

# Operating Systems, Spring 2014

## Homework Assignment #1

Due midnight Monday, March 24, 2014

### Instructions

1. If any question is unclear, please ask for a clarification.
2. You are required to do all the homework assignments on either Linux or Minix version 3.1.2a running on QEMU, which in turn runs on Linux.
3. You are required to give your TA a demo of your program. Make sure that your Linux can be logged in using `ssh` so that your TA can grade your homework remotely.
4. Unless stated otherwise, you are required to work on the homework assignment individually.
5. No late homework will be accepted.
6. No cheating.

### Part I (50%)

As a preparation step for the second part of this and later homework assignments, for the first part of this homework assignment, you are required to do the following.

1. Install Linux on your computer. It is up to you to choose a distribution that you prefer.<sup>1</sup> Make sure that it can connect to the Internet.
2. Recompile the kernel that comes with the Linux distribution you chose. Make sure that the version number of the newly compiled kernel is the original version number suffixed with your student ID. For instance, the student ID of one of your TA's is m983040031, and the version number of the kernel is 2.6.37.4, then the version number of the newly compiled kernel will be 2.6.37.4-m983040031.

---

<sup>1</sup>Here are some Linux distributions that you might be interested.

- Debian: <http://www.debian.org/>
- Fedora: <http://fedoraproject.org/>
- Gentoo: <http://www.gentoo.org/>
- Ubuntu: <http://www.ubuntu.org.tw/>

Hand in a report to show that the newly compiled kernel works by showing the output of the following commands:

- `uname -a`
- `ifconfig -a`
- `ping 140.117.11.1`

Make sure that your TA's can log in to your system to verify the results you show on the report.

If you never use Linux before, start earlier. It may take you quite a while to get it up and running.

## Part II (50%)

For the second part of this homework assignment, you are required to write a shell that is similar to Fig. 1–10 of the text but contains enough code so that it actually works and you can use it as a shell on Linux.

For full credits, here are the minimum requirements of the shell you are required to write.

1. It should be able to run all the single-process commands.
2. It should be able to run all the two-process pipelines, the skeleton of which is as given in Fig. 1–13 of the text.
3. It should be able to handle input and output redirection.
4. It should be able to execute commands in the background.

You are, of course, free to add more features to the shell you write.

In addition, all the programs you write must be well organized and come with a Makefile that can be used to correctly compile your program. *Without a Makefile, your homework assignment will not be graded—meaning that you will receive zero points.*

## Grading Policy

The grading policy for this homework assignment is as follows:

- 50 points for correctly setting up the environment, meaning that you TA can remotely log in to your Linux.
- 10 points for the shell if it is capable of executing all the single-process commands correctly.
- 15 points for the shell if it is capable of executing all the two-process pipelines correctly.
- 15 points for the shell if it is capable of handling input and output redirection correctly.
- 10 points for the shell if it is capable of executing commands in the background correctly.

## **Gentle Reminder**

*Once again, as mentioned in the instructions, no late homework will be accepted.*
